

**Exercise number 2 (due 23 Apr):**

**Exercise 1.4 (page 13):** Modify `dup2` to print the names of all files in which each duplicated line occurs (`map[string][]string` can be used to hold a list of file names per input text line).

**Exercise 1.7 (page 17):** The function call `io.Copy(dst, src)` reads from `src` and writes to `dst`. Use it in `fetch` instead of `ioutil.ReadAll` to copy the response body to `os.Stdout` without requiring a buffer large enough to hold the entire stream. Be sure to check the error result of `io.Copy`.

**Exercise 1.9 (page 17):** Modify `fetch` to also print the HTTP status code, found in `resp.Status`.

The “Bodek” asked to follow few points for the next submission:

- Single `.txt` file for the `.go` sources is preferred - indicate clearly in this file where each part of the sources starts and ends.
- Format your code for readability
- Don't forget to hand the `details.txt` file.
- Please write `details.txt` in English
- Make only one submission - no need for other partners to send anything (not even `details.txt`)
